

ForgeRock Autonomous Identity

Achieve regulatory compliance, mitigate risks, and reduce costs with AI-driven identity analytics

Reduce Cyber Risks with Least Privilege Access

Organizations are under growing regulatory compliance pressures while being assailed with unauthorized access attacks and data breaches due to increasing insider and external threats.

The problem is traditional identity governance solutions are static, siloed, labor intensive, and cannot scale to meet the dynamic needs of the modern enterprise.

A new innovative approach to modernize identity governance is a must. Artificial intelligence (AI) is an ideal foundation for enabling this digital transformation.

ForgeRock Autonomous Identity is an AI-driven identity analytics solution delivering user access landscape visibility, risk awareness, and remediation recommendations. By leveraging AI and machine learning, you can modernize identity governance and role-based access control (RBAC) solutions to achieve least-privilege access in a Zero Trust world.

Features

Enterprise-wide Risk Visibility

Reduce risk exposure with contextual insights into all identities and risk across the entire user access landscape.

AI-Driven Access Reviews

Eliminate certification rubber stamping by automatically approving or revoking low-, medium-, or high-confidence user access, roles, and entitlements.

AI-Driven Access Approvals

Accelerate system application access by automatically approving and provisioning high-confidence user access.

Role Engineering

Reduce role maintenance by quickly discovering role-based access patterns and recommending optimized role structures.

Key Benefits

Reduce Risk Exposure

Quickly identify bad access across the organization.

Boost Operational Efficiency

Reduce operational costs with automated access request and certification reviews.

Accelerate Role Optimization

Lower risk exposure by modernizing role-based access controls (RBAC).

Our Approach

ForgeRock Autonomous Identity leverages AI and machine learning to collect, analyze, and identify security access and risk blind spots. As a stand-alone solution or by integrating with your existing identity governance solution, Autonomous Identity provides you with wider and deeper insight into the risks associated with user access by providing enterprise-wide contextual insights, high-risk user access awareness, and remediation recommendations.

Step 1

All identity data is collected, analyzed, and modeled across the entire enterprise.

Step 2

Confidence scores are calculated and distributed in low-, medium-, and high-risk user access levels.

Step 3

Confidence scores are reviewed and analyzed by distribution and justification.

Differentiators

Global Visibility

Contextual insights into low-, medium-, and high-risk user access across the entire organization.

Data Agnostic

It takes into account data and any data. Collect and analyze identity data to create a user access landscape overview, highlight potential risks, and user access recommendations.

Transparent AI

Fully comprehend how and why potential access risks and recommendations are determined base on enterprise-wide confidence scores.

Role Optimization

Automatically discover role-based access patterns across the entire organization and recommend optimized role structures.

Business Outcomes

60%

Time Savings

Reduction in access requests, revocations, and certifications.

20X

Security Improvements

Increase in access outlier revocation rates.

70%

Risk Reduction

Reduction of required roles in major ERP application.

80%

Customer Experience

Click-rate reduction in certification review process.
